    No. 18 the number of results predicted by chance to have a
re greater than or equal to the score of the result being printed,
is derived by analysis of the total score distribution.

It comprises 5 exons. It is a member of the ER-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation or adaptive processes functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those involving aberrant muscle cell development and functional activity. It is also used in the treatment of muscular and myotonic dystrophies, skeletal myopathies such as Duchemne muscular dystrophy and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, cused in gene therapy, for the production of transgenic animals and for

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTs are not well suited for isolating cDNA sequences derived from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTs are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs 5' ESTs are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present sequence is one of a large number of 5' ESTs derived from mRNAs encoding secreted proteins. An ORF has been identified within the sequence. The 5' ESTs were prepared from total human RNAs or polyA+ RNAs
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; 5' EST; expressed sequence tag; gene therapy; chromosome mapping; ss.

                                                                                              The patent discloses novel target genes abnormally expressed in heart tissues and their corresponding proteins. The invention also relates to methods for assessing the expression level of these genes. The method is used for testing the predisposition of mammals and preferably humans for a heart disease or for an acute state of such a disease. It is also useful to treat diseases of the heart such as congestive heart failure, dilative cardiomyopathy, hypertrophic cardiomyopathy, specific heart muscle disease, rhythm and conduction disorders syncope and sudden death, coronary heart disease, systemic arterial hypertension, pulmonary hypertension, pulmonary heart disease, valvular heart disease, congenital heart disease, pericardial disease and endocarditis. Sequences of the invention are also used in gene therapy.
                                 A transgenic non-human mammal comprising the sequences of the invention are also used in gene therapy. As transgenic non-human mammal comprising the sequences of the invention are useful for the development for medicaments for the treatments of heart diseases. The present DNA sequence is expressed sequence tag (EST) 66214 clone.

The present sequence is the CDNA encoding the murine chisel gene (Csl) that is mapped to the mouse X chromosome. It is a member of the EF-Hand protein super family and is involved in signalling pathways. It is predominantly expressed in heart and skeletal muscles and is activated after the differentiation of cells. Csl functions in regulation aspects of differentiation or adaptive processes that maintain muscle homeostasis. This sequence can be used in the detection, diagnosis, prophylactic and therapeutic treatment of diseases such as those

It is also used in the treatment of muscular and myotonic dystrophies, skelated myopathies such as Duchenne muscular dystrophy and Becker's myotonic dystrophy, heart failure, cardiac hypertrophy, myocarditis, myofiber atrophy, etc. The Csl gene sequence can also be used in gene therapy, for the production of transgenic animals and for drug screening.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   adult respiratory distress syndrome; inflammatory bowel disease; Crohn's disease; ulcerative colitis; periodontal disease; granulocyte activation; chronic inflammation; allergy.
                       The invention relates to detecting (M1) granulocyte (GC) active (GCA), by detecting the level of expression of gene(s) (Gs) to NA chip analysis as given in the specification, and comparing the expression level to an expression level in an unactivated
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  fungal infection; sterile inflammatory disease; psoriasis; rheumatoid arthritis; glomerulonephritis; asthma; thrombosis; cardiac reperfusion injury; renal reperfusion injury; ARDS;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     14-AUG-2002
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ABK83560 standard; cDNA; 86574 BP
                                                                                                                                                                                                                                                  Detecting granulocyte activation of genes associated with granuloc diagnostic markers that is useful

CC. Also included are modulating (M2) GA by contacting GC with an agent that alters the expression of at least one gene in Gs; (2) screening (M3) CC for an agent capable of modulating GCA or an inflammation (especially CC chronic) in a tissue, an allergic response in a subject, exposure of a CC subject to a pathogen or sterile inflammatory disease using the CC gene expression profile; (3) detecting (M4) an inflammation (especially CC chronic) in a tissue, an allergic response in a subject, exposure of a CC subject to a pathogen or sterile inflammatory disease, by detecting the level of expression of the gene is indicative of inflammation; (CC an allergic response in a subject, exposure of a cor sterile inflammatory disease, by contacting a tissue having CC from Gs in the tissue. M1 is useful for detecting GCA; M2 is useful for cor sterile inflammatory disease, by contacting a tissue having CC from Gs in the tissue. M1 is useful for detecting GCA; M2 is useful for creponse in a subject, exposure of a subject to a pathogen of the detecting an inflammation (especially chronic) in a tissue, an allergic cresponse in a subject to a subject to a pathogen or creponse in a subject to a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoid arthritis, cor creponse in a subject, exposure of a subject to a pathogen or sterile conflammatory bowel disease, Crohn's disease, ulcerative colitis, cor parasitic infection, protozoal infection, fungal infection and M5 is useful for treating one of the above conditions. The present conditions are part of the printed specification, but was obtained in electronic format directly from WIPO at this patent did not form part conditions and make the printed specification, but was obtained in electronic format directly from WIPO at

                                                                                                                                                                                                                                                                        밁
                                                                                                                                                                                                                                                                                                  ঠ
                                                                                                                                                                                                                                                                                                                                                                                                 corresponding secreted proteins are useful for preventing, treating or can meliorating medical conditions, e.g. by protein or gene therapy. Also conditions can be diagnosed by determining the amount of the proteins in a sample or by determining the presence of mutations in the collectives, based on which tissues they are most highly expressed in, and include developing products for the diagnosis or treatment of cancer, tumours, neurodegenerative disorders, developmental abnormalities and foetal deficiencies, blood disorders, diseases of the immune system, cantoimmune diseases, hepatic and renal diseases, inflammation, caltergies, Alzheimer's and behaviourzi disorders, schizophrenia, cord cransplant rejection, disbetes, asthma, sepsis, acne, psoriasis, cardiovascular disorders, reproductive disorders, gastrointestinal cord disorders, respiratory disorders and metabolic disorders. The proteins or polynucleotides can also be used as food additives or preservatives. Chaptels are also useful for identifying their bridging partners. Chaptels are also useful for identifying their binding partners.

The human secreptoceins can have activities based on the tissues and cells they are expressed in. Examples of the activities are: cytostatic;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated human genes and the secreted polypeptides they enco useful for diagnosis and treatment of e.g. cancers, neurological disorders, immune diseases, inflammation or blood disorders -

Mammalian cells conjugating enzymes (UCE) 7, 8, and 9 respectively. Mammalian cells contain two distinct proteolytic pathways, one of which is ubiquitin content of ubiquitin to the proteolytic pathway requires the post-translational catachment of ubiquitin to other proteins using UCEs, such as the encoded proteins. Ubiquitin-protein conjugation is highly selective and is required for a large variety of cellular functions, including DNA crepair, cell viability, heat shock resistance, and cell cycle progression. The UCEs 7, 8, and 9 may also play a role in selective protein degradation in human cells. The UCE proteins encoded by these sequences can be used to treat patients that require one of the UCEs, or need one of the UCEs inhibited. The three UCEs can also be used to treat immunosuppression related disorders, such as CL AlDS, or to regulate immunological disorders such as hymenoptera venom thypersensitivity or aspirin-induced asthma. Antagonists against the UCEs can be used to treat disorders such as Alzheimer's disease, catcophying skeletal muscle, African swine fever virus, and apoptotic cell
                                                                                                                                                                                                                                                                                                                                                                                            Best Loc

Ubiquitin conjugating enzyme-7, -8 and -9 and encoding DNA - used i

Example 1; Column 29-30; 32pp; English

CC (UCE) 7. UCE polypeptides were expressed intracellularly via gene CC therapy and can be used to provide a signal for the lymphocyte common receptor, thereby regulating lymphocyte trafficking. The growth common receptor is modified by ubiquitin and UCE polypeptides may be used to regulate growth hormone activity. UCE polypeptides can be used to overcome viral infection by suppressing programmed cell death, e.g. cc in the treatment of ADDS. They can also be used to inhibit the cytotoxic properties of platelets and the production of oxygen metabolites by cc platelets. They may be used to regulate immunological disorders in which cc platelets seem to be involved, e.g. hymenoptera venom hypersensitivity cc and aspirin-sensitive asthma. The UCE polypeptides may also be used to treat malignant transformation because proto-oncoproteins c-Mos and co v-Jun are degraded in a ubiquitin-dependent manner. UCE antagonists, care able to pass through the cell membrane and to the proteins catalyses the transfer of ubiquitin to a substrate and marks that common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that the common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that the common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that the common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that the common to the proteins catalyses the transfer of ubiquitin to a substrate and marks that the common to the proteins catalyses the transfer of ubiquitin to the proteins catalyses the transfer of ubiquitin to the proteins catalyses the transfer of ubiquitin to the AAT79814 is a cDNA sequence encoding human ubiquitin conjugating enzyme foliaceus.

                                                                                                                                                                                                                                                                                                                                                                                        RESULT 12
                                                                                                                                                                                                  밁
                                                                                                                                                                                                                              Ś
                                                                                                                                                                                                                                                                                                                                                                                                                             This sequence encodes a ubiquitin conjugating enzyme (UDCB). The CC invention relates to assays for identifying an inhibitor of ubiquitin-mediated proteolysis of a cell-cycle regulatory protein cc ubiquitin-mediated proteolysis of a cell-cycle regulatory protein cc comprising contacting a candidate agent with an ubiquitin-conjugating system comprises: (a) a reconstituted protein mixture including a ubiquitin conjugating enzyme (UDCB) produced by the cxpression of a nucleic acid which hybridizes under high stringency conditions to human UDCE, Candida albicans UDCE, or Schizosaccharomyces CC conditions to human UDCE, Candida albicans UDCE, or Schizosaccharomyces CC pombe UDCE coding sequences; (b) a regulatory protein; and (c) ubiquitin. The polymucleotides are useful for identifying ubiquitination inhibitors. CC The polymucleotides polypeptides, antisense compounds and antibodies against them may also be useful for the treatment and/or diagnosis of creative disorders (e.g. cancer, atherosclerosis, or restenosis), ctissue connective disorders, controlling wound healing, and disorders characterized by fibrosis (e.g. rheumatoid arthibits, insulin dependent disorders feet and controlling wound healing).
                                                                                                                                                                                                                                                                                                                                        Query Match

Identifying modulators of I-kappa-B proteolysis - used to develop products for treating e.g. proliferative and/or differentiative disorders, infections, tissue wasting, cachexia or AIDS

Page 64-65; 79pp; English.

CC ligase and ubiquitin, to promote ubiquitination of the Ikappas CC polypeptide by the HECT ligase; (b) contacting the ubiquitin-conjugating CC system with a candidate agent; (c) measuring a level of ubiquitination of CC the polypeptide in the presence of the candidate agent and (d) comparing CC the measured level of ubiquitination in the presence of the candidate agent with ubiquitination of the IkappaB polypeptide in the absence of the candidate agent is indicative of an inhibitor of ubiquitination of the IkappaB polypeptide in the presence of the CC modulate agent is indicative of an inhibitor of ubiquitination of the CC modulate binding and/or ubiquitinylation of an IkappaB (or other cellular CC or viral substrate) by a HECT ligase, such as RSC or KIAAN. Such CC modulators can be used e.g. in the treatment of proliferative and/or CC differentiative disorders, to modulate apoptosis, in the treatment of CC viral infections, and in the treatment of tissue wasting disorders e.g. CC cachexia secondary to infection or malignancy, cachexia secondary to infection or malignancy, cachexia secondary to the conditate and other arthritis, rheumatoid spondylitis, CC ostoratoritis, gouty arthritis and other arthritic conditions, sepsis, CC respiratory discress syndrome, cerebral malaria. Chronic milmonary respiratory distress syndrome, cerebral malaria, chronic pulmonary inflammatory disease, silicosis, pulmonary sarcoidosis, bone resorption diseases, reperfusion injury, graft versus host reaction, allograft rejections, Crohn's disease, ulcerative colitis, or pyresis, in addition to a number of autoimmune diseases such as multiple sclerosis, autoimmune diseases such as multiple sclerosis, autoimmune diseases, systemic lupus erythematosus; and ENL in leprosy, HIV, and This invention describes a novel assay identifying an inhibitor of ubiquitin-mediated proteolysis of a IkappaB polypeptide. The method comprises: (a) providing a ubiquitin-conjugating system including the IkappaB polypeptide and a HECT (Homologous to B6-Ap Carboxyl Terminus ligase and ubiquitin, to promote ubiquitination of the IkappaB This sequence encodes a human UBC4 protein which is used Terminus) ij autoimmune

to mark cells (particularly virus-infected) for death and to screen for agents (antagonists and agonists) that interact with them. The UCE products are also used to regulate lymphocyte trafficking or activity of the growth receptor, to treat many viral infections (by overcoming virus-induced suppression of apoptosis), for treating immune suppression (particularly acquired immune deficiency syndrome), to treat cytotoxic effects of platelets and their production of oxygenated metabolites. The

The present sequence encodes a human ubiquitin conjugating enzyme 7 (UCE7). The UCE products are used to treat malignant transformation (where associated with c-Mos and v-Jun proto-oncoproteins, since these undergo ubiquitin-dependent degradation) or immunological disorders (e.g. hypersensitivity to wasp/bee stings or aspirin-sensitive asthma),

(e.g. hy

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              UCE protein is used to raise antibodies, useful in diagnostic immunoassays and as a therapeutic inhibitor. Antagonists of the UCE protein are used to treat atrophy of skeletal muscle, cervical cancer (and some other tumours), endemic pemphigus foliaceus and African swine fever, or generally any condition in which UCE catalyses transfer of ubiquitin to a substrate, marking it for cell death.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        CC The invention relates to a method of identifying an inhibitor of CC ubiquitin-mediated protoolysis of a cell cycle regulatory protein CC comprising contacting an engineered enkaryotic cell with a candidate CC comprising contacting an engineered to express a recombinant CC human, Candida albicans or Schizosaccharowyces pombe ubiquitin-CC conjugating enzyme (AAB03169-B03171), a cell cycle regulatory protein (cc candida albicans and Schizosaccharowyces pombe ubiquitin-conjugating enzyme (AAB03171), a cell cycle regulatory protein CC candida albicans and Schizosaccharowyces pombe ubiquitin-conjugating cc ubiquitin-conjugating enzymes, hUDCE and rapUBC (AAB03173), and two novel human cc ubiquitin-conjugating enzymes, hUDCE and rapUBC (AAB03173), and two novel human cc ubiquitin-conjugating enzymes, hUDCE and rapUBC (AAB03173).

CC The ubiquitin-mediated protoclysis system is the major pathway for the selective, controlled degradation of intracellular proteins in cell cycle progression. Alterations in the ubiquitination of cc involved in cell cycle progression. Alterations in the ubiquitination of these proteins may therefore play a role in the development of cancers. For example, human papillomaviruses such as HPV-18 encode a transforming protein, Bc (AAB03177) to stimulate the ubiquitination of protein (Bc-AP, AAB03177) to stimulate the ubiquitination of post the method of the invention are useful for treatment of protein, Bc (AAB03176), which combines with a cellular Bc-associated corructal cancers and connective tissue disorders and for controlling the epidermal conditions such as spooriasis, neoplastic epidermal conditions, such as spooriasis, neoplastic proterm of hyperplasic epidermal conditions such as spooriasis, neoplastic epidermal conditions, such as spooriasis, neoplastic epidermal conditions,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        문

                                                                                                                                                                                                                                                                                                                                                                                                              A cDNA sequence (AAT41769) comprises the coding region for human ubiquitin-conjugating enzyme UBC4 (AAW0352). It was obtd. from an HeIa cDNA library by PCR amplification (see also AAT41765-68). The cDNA was incorporated into a baculovirus vector and used to produce recombinant UBC4 in Spodoptera frugiperda 5:59 cells, and into a pGEX vector to allow UBC4 prodn. in E. coll. UBC4 can be used in a novel ubiquitin-conjugating system to identify inhibitors ubiquitin-mediated proteolysis of cell cycle regulatory proteins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Detecting inhibitors of ubiquitin-mediated proteolysis of CCRPs - used in the treatment of proliferative and/or differentiation diseases, and in modulation of apoptosis
                                                                                                                                                                                                                                                                                                                                                                         Sequence 452 BP; 134 A; 101 C; 92 G; 125 T; 0 other;

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

Sequence starts with base I following the determined vector sequence (ACCGGTGgCGTCgCGTC, small letters: NotI-site). ESTS 3055-L0R-8H11-2, 3055-10U-8H11-2 (with vector primers) and 8H11-R1-C8-OZ, 8H11-U1-C7-OZ (with gene specific primers) provide a contig of the whole insert of clone xh8H11. Insert Length: 850 Std Error: 10.00
